

The Impact of Information Attacks on the Education of the Younger Generation

Dehqonov Anvar

Teacher, Namangan Engineering – Construction Institute, Uzbekistan, Namangan

ANNOTATION: This article covers the penetration of information flow in the condition globalization, in particular the impact of information attacks on youth education.

KEY WORDS: youth, information attack, mass media, Internet, education, educational factors, social life.

Today, the younger generation of adulthood has made use of the tremendous opportunities created by science and technology, while entering all spheres of life and effectively using its results, while trying to change their views and lifestyle. Already from the material and spiritual wealth created in all centuries, which until the first twenty years of the 21st century was long, introduced results into the ashes and achieved unprecedented results with the help of high information and communication technologies, the internet system. In today's era, it is impossible to imagine human life, especially the life of young people, without the media. In particular, television is one of the greatest discoveries of the twentieth century, but also the most influential in the media, according to its audiovisual nature. Television and the Internet have been ranked as an effective and influential medium of information exchange as well as communication process. Audiovisual tools have been following us throughout the day, setting our lifestyle apart from our vacations as well, informing, educating, and educating about world events. The scale, shape, idea and quality of information disseminated through these means cause the perception of a modern person, sometimes a change in his worldview, cultural views, the formation of an unusual attitude to values.

As we all know, the formation of the personality of the younger generation occurs under the influence of a number of factors. The most important of these factors will be directly related to its pure-mannered heritage, exemplary upbringing in the family, social environment in the neighborhoods, the importance of youth education in schools and other educational institutions.

The main purpose of education is to enable the growing younger generation to find its strong position in society, as an educated, wise and healthy – minded person, which is characteristic of perfect people.

The main task of education is the expression of the younger generation from finding content that corresponds to the rules of conduct adopted in our society, moral qualifications and skills, needs and aspirations.

In his work "Turkic Gulistan or morality", Abdulla Avlani emphasized the role of education in human perfection and said: "Sir, he created the right people as talented and capable in the noble world, with good and evil, with profit and loss, with white and black. But to bring this ability in a person to perfection is in the means of upbringing. It turns out to be a happy

person if the child is well brought up, preserved from a corrupt behavior and is big, addicted to beautiful behavior. If an ill-mannered, morally corrupt person grows up, he becomes a foolish, ignorant "rasvoi" person who does not take heed, does all sorts of corrupt deeds. In these words, it is more obvious how the education is of great importance in human perfection.

At present, in addition to the influence of family, neighborhood, school and educational institutions in the education of the younger generation, the product of globalization processes-the factor of means of rapid information transmission and Exchange through various Internet networks-should be kept in the center of attention. It is alarming that they are entering the lives of our young people through indecent, hurtful films and various absurd games, which promote various destructive ideas in their means, poison the minds of young people.

It is also worth paying attention to the fact that in our country there are more and more mass publications, among which the level is slightly lower, "Entertainment" is light-the material that expresses the way of life, does not correspond to our national mentality from a moral point of view, also comes to the attention of young people.

In this regard, we believe that attention should also be paid to the various radio-televedenies that are currently operating, although today it has decreased for a while, unfortunately, some "side" cinema films and broadcasts, light songs, which are broadcast, are also deeply concerned about the negative impact on the minds of our young people.

The most important thing is that in any society, no matter what form it is intended for, young people express their attitude towards any new idea, different new conceptions, and receive faster than the other layer of the population. Because young people are still at the stage of formation, both physiologically and psychologically, there will be a great need for them to be able to perceive and understand the news more quickly than others and at the same time. Young people are also characterized by the features of rapid onset of new phenomena, as well as rapid transmission of negative phenomena. Young people are characterized by a high level of ability to adapt to rapidly changing conditions in society, according to their socio-psychological and other characteristics. They belong to such a social group of society that the consciousness of representatives of this group is in the process of formation, which is quickly given to the influence of various ideas (including both destructive ideas). They also have the ability to know the acute trait and more accurately perceive cases of inconsistency of practice with the word.

The very fact that the information age is at increased risk for the organism of young people can be explained by many cases in medicine. For example, doctors absolutely forbid to take medicines (vitamins), which are useful for the body during the period when there is a disease in the body. The reason is that the function of vitamins is to improve the activity of cells and bacteria, and in the period of illness sends the activity of bacteria that cause disease. Especially, in adolescence, when the body undergoes active psychophysiological changes, and in order to resist a strong influx of information, the human body becomes impotent. Due to the decrease in mental immunity in them, various information causes not only internal sensations of the teenager, but even changes in his character.

Because of the one-second fear caused by panic attacks, a break in the blood supply of the brain occurs during this time interval. This means the absorption of thousands of cells. And the filling of the place of the cells of the brain in the head leads to a headache.

Information transmitted through television is an obvious influence of visual energy, which has a character of this wave. This energy initially artificially provokes the symptoms of mental illness and keeps the body in constant subjugation. This situation is no different from the situation of a person who has become a "slave" of drugs. That is, a person constantly needs information and carries out his behavior in the influence of this information. And this means a mental infection.

Teleinformation takes a person first of all under its influence, and then with the help of hearing and visual organs it occupies all layers of the brain. After 20-25 minutes of telecoms, the viewer gets tired of analyzing, and the brain begins to perceive information directly, regardless of what size it is. Sitting in front of the TV at night slows down the body's external activity. The information received at night is sealed directly under consciousness. Thus, for a person who is tired of mental and physical exertion during the day, it is not easy to analyze and draw conclusions from this information. This can lead to its "depressive" state.

One of the main tasks of the mass media is to increase the social activity of the population. However, an increase in the amount of information received from the norm causes the mind of the reader to form in a certain "pattern". Because the flow of information of large size and speed makes a person become an audience that is limited to hearing and seeing, his ability to reason and draw conclusions is limited. The information in this case turns into "social drugs".

In conclusion, there is no possibility to use the flow of information in the interests of human beings and subjugate them to their goals. The rational use of this depends on the intellectual potential of man, on the spiritual world, on faith, on his strength-will. In today's global environment, we need to apply them consciously and purposefully, that is, in the formation of feelings of patriotism, the use of national education, enlightenment, in an increasing scale of possibilities of influence of modern technological means.

It should be noted that the places occupied by the neighborhood elders and luminous fireplaces, mothers are important for our young men and girls to enter into an independent life, young families to find their place, for the content of kindness and solidarity among the people. Parental responsibility plays a special role in the spiritual education of young people. The most pure and pure feelings of Man, the first concepts of life, worldviews, goodness and goodness, nobility and mexr-the sacred concepts necessary for such a person as or-shame, anxiety-begin to find a decision in the family at first, and then move to the community.

In order to fully meet the spiritual needs of young people, it will be necessary to raise to a new level of quality all the spheres that can directly affect the education and education: Press, television, cinema, theater, literature, music, art and sculpture, the Internet of Information Media, in general, the human soul and thinking. At the same time it is necessary to eliminate the speed of the existing minor shortcomings and defects in these areas and get rid of such negative situations.

The importance of philosophical, social, political and humanitarian Sciences in the spiritual education of young people in our country can not be overemphasized, for this reason, representatives of these disciplines will have to fulfill their extremely responsible tasks at the level of today's demand. Textbooks, manuals, literature and specialists in this field are also required to have high levels.

In conclusion, it can be said from the above that in order to enlighten the spiritual world of

our people and above all our young people and to preserve their inviolability, it is necessary to constantly be alert, alert and considerate, to conduct spiritual education, which is deeply thought out against threats, based on scientific method and which will last forever.
